Implementing an Instrument-Based Vision Screening Program?
What You Need to Know

P. Kay Nottingham Chaplin (EdD)
Bruce Moore, OD, New England College of Optometry
Sandra S. Block, OD, Med, FAAO, FCVD, Illinois College of Optometry

Introduction and Disclaimer

☞ 16 years in vision screening field

☞ Former Director/Lead Trainer – Vision Initiative for Children – West Virginia University Eye Institute

☞ Member –Advisory Committee to the National Center for Children’s Vision and Eye Health at Prevent Blindness

☞ Current Education and Outreach Coordinator for the National Center for Children’s Vision and Eye Health at Prevent Blindness

☞ Current Director – Vision and Eye Health Initiatives at Good-Lite and School Health Corporation

☞ Not in sales . . . The opinions expressed in this presentation are solely those of the presenter based on research and professional experience.
Introduction and Disclaimer

- 40+ years as a pediatric optometrist, Marcus Professor of Pediatric Studies at the New England College of Optometry
- Devoted to studying visual problems and treatment options for young children
- Published more than 200 papers, posters, chapters, and 2 textbooks related to pediatric optometry
- Member of National Expert Panel to the National Center for Children’s Vision and Eye Health at Prevent Blindness
- A principal investigator in a National Eye Institute-funded multicenter study – the Vision in Preschoolers (VIP) Study

Introduction and Disclaimer

- Professor, Illinois College of Optometry where she has been an active clinician, lecturer, and researcher for 35 years.
- International lecturer advocating for access to eye care for children and individuals with intellectual and developmental disabilities.
- Global Clinical Advisor, Special Olympics Lions Clubs International Opening Eyes Vision Program.
- Past co-chair, National Center for Children’s Vision and Eye Health at Prevent Blindness, current member.
- Board member, Prevent Blindness and the Illinois College of Optometry.
Info You Will Take Home …
4 Learning Objectives

1. Describe what instruments measure when screening vision.
2. Describe why refractive error measurements should not be converted to visual acuity numbers.
3. Describe the age at which instrument-based vision screening can begin.
4. Describe 2 evidence-based instruments.

6 Topics

1. How instrument-based screening differs from optotype-based screening (i.e., eye charts)
2. Ages when instruments can be used for vision screening
3. Answers to commonly asked questions from the field (i.e., for preschoolers, should I do both instruments and eye charts?)
4. Children who should bypass vision screening and receive referral from medical home for eye exam
5. Resources
6. Answers to your BURNING questions
Glossary

- Instrument-based screening – using automated devices or instruments to screen vision
- Optotype-based screening – using eye charts or software to screen vision and report pass/fail or 20/XX number for each eye
- Tests of Visual Acuity – another name for eye charts or software that require pass/fail or 20/XX number for each eye
- NCCVEH – National Center for Children’s Vision and Eye Health at Prevent Blindness
- AAP – American Academy of Pediatrics, American Association for Pediatric Ophthalmology and Strabismus, American Academy of Ophthalmology, American Association of Certified Orthoptists

Instruments “Approved” by NCCVEH

Welch Allyn® Spot™ Vision Screener
plusoptiX Portable S12C Vision Screener
Implementing an Instrument-Based Vision Screening Program? What You Need to Know

2 Approaches to Vision Screening

1. Optotype-based screening
   - Tests of visual acuity using optotypes to measure visual acuity as interpreted by the brain
     - Quantifiable measurement of the sharpness or clearness of vision when identifying black optotypes on a white background using specific optotype sizes at a prescribed and standardized distance

2. Instrument-based screening
   - Instruments do not measure visual acuity
   - Instruments analyze images of the eyes to provide information about amblyopia and reduced vision risk factors:
     - Estimates of significant refractive error (hyperopia, myopia, astigmatism)
     - Estimates of anisometropia
     - Estimates of eye misalignment (some, not all)

Ages for Instrument-Based Screening

- Use beginning at 12 months; better success at 18 months (AAP)
- Use instruments OR tests of visual acuity for children ages 3, 4, and 5 years (NCCVEH and AAP)
- Instruments at any age for 6 years and older if child or young adult cannot do test of visual acuity (AAP)

http://nationalcenter.preventblindness.org/publications-and-presentations
What does an optotype tell me?

- Visual acuity measured with optotypes are the means that has been classically considered in telling how well a person can see at a fixed distance.

- 20/20 – what we all expect everyone to see!
- 20/25-20/40 still acceptable for children
- Poorer than 20/40 – referral

- It translates to how well one can see while viewing a distance target.

Optotypes come in many forms

- Some Good:
Do I need to do both optotype- and instrument-based screening when I screen vision?

- What is used with children before they know their alphabet?

  Optotypes come in many forms
  - Some not so good:
Do I need to do both optotype- and instrument-based screening when I screen vision?

- What are some of the reasons to use instrument-based screening?
  - Speed and efficiency
  - Accuracy – with untrained screeners, optotype may not be accurate
  - Auxiliary screeners – Lions Clubs
  - Younger children or children with special needs

- Are the instruments testing for optotypes?

- What is measured with instrument-based screening?
  - Refractive Error
    - Nearsightedness
    - Farsightedness
    - Astigmatism
If the instrument recommends an eye exam, do I rescreen with a test of visual acuity before referring?

- Each instrument for vision screenings is set to discriminate acceptable and unacceptable readings.
- If the reading for the child is higher than the threshold set, that suggests that the child likely has more refractive error than is considered at a pass rate.
- The outcome of that screening is refer!

From School Health document - https://www.schoolhealth.com/media/pdf/Spot_Sample_Results.pdf

http://nationalcenter.preventblindness.org/publications-and-presentations
What Is “Capture Rate”?

- Some instrument websites provide info about a “capture rate” of 97%.
- Varies based on several factors including:
  - Environment critical
  - Child’s behavior & attention
  - Child’s visual status

From School Health document -
https://www.schoolhealth.com/media/pdf/Spot_Sample_Results.pdf
If I cannot get a reading because the pupils are too small, what do I do?

- There are two primary reasons for “small pupil”
  1. Room illumination too high
  2. Child’s visual status, especially hyperopia

If I cannot get a reading because the wheel continues to spin and the device times out, what do I do?

- Environmental issues
- Child’s visual status
- Child’s behavior
TIPS for Instrument-Based Screening

- Sunglasses
- Hands shading eyes
- Lower room lights
- Check for glare from window
- Wearing prescription glasses? Slightly lower head
- “Wiggle your toes”

What do I do when my paperwork wants a 20/XX number for each eye?

- You cannot convert estimated refractive error to visual acuity value.
- Why not? You are measuring two different aspects of vision.
- Child could fail vision screening with instrument, but pass with conversion and miss opportunity for eye exam.
**Conversion Chart: Refractive State to “estimated” Visual Acuity**

<table>
<thead>

[1] Spherical results are based upon minus (-) cylinder correction.

*Not Recommended for conversion of screening results for children screened for amblyopic risk factors.*

---

**Children Who Should Bypass Vision Screening and Go Directly to Eye Exam - NCCVEH**

- Readably observable ocular abnormalities
- Neurodevelopmental disorders, such as:
  - Hearing impairment
  - Motor, such as CP
  - Down Syndrome
  - Cognitive impairment
  - Autism Spectrum Disorder
  - Speech / Language Delay
- Systemic conditions with ocular abnormalities, such as:
  - Diabetes
  - Strabismus
  - Juvenile Arthritis
  - Amblyopia
- Parents or siblings with history of:
  - Strabismus
  - Amblyopia
- History of prematurity
  - < 32 completed weeks
- Parents who believe their child has vision problem
  - Message to primary care providers: Don’t wait and see
  - Don’t wait and see

If **Required to Screen All Children** . . .

- Use same vision screening tools you use with all children.
- If children are untestable, refer to child’s medical provider.
- If children pass, explain to parents that the screening result does not check for everything:
  - Because these children are at a higher risk of having an eye disorder.
- A comprehensive eye exam remains recommended for these children.

Consensus of the Technical Guidance Subcommittee to the National Center for Children’s Vision and Eye Health - 2.16.17. Subcommittee includes pediatric ophthalmologists and pediatric optometrists.

Suggested Text for Your Family Information and Referral Letters

Text to add to your existing referral letters:
- We refer children for an eye exam when they do not pass vision screening. We also refer children who may pass a vision screening if they are at a higher risk of having a vision disorder because of a medical or developmental reason.

Include on your referral document:
- Reason for referral: Increased risk for vision disorder because of developmental or medical reason (describe):

Implementing an Instrument-Based Vision Screening Program? What You Need to Know

Children's Vision Screening Training and Certification

Prevent Blindness has the only national program for training and certifying vision screeners.

Our children's vision screening training and certification program focuses on consistent, highly effective screening services. Prevent Blindness' professional advisors recommend screening tools designed to accurately detect children's vision problems. The training and certification program prepares screeners to do the best possible job.

Join Prevent Blindness and its 15,000 volunteers. Become a vision screener!

Contact us about vision screening training and certification, or call 1-800-331-2020.
